IN THE CLAIMS

Please amend the claims as follows:

Claim 1. (Original) A shaft having a shank with a splined portion that is spline engaged with a fitting member, and with an external diameter portion that is formed with a distance of separation from the splined portion, both the splined portion and the external diameter portion being formed in an outer peripheral surface of the shank, comprising:

any one of a curved portion, a plurality of curved portions, and a plurality of curved portions and at least one straight portion, that extend continuously so as to connect a cut back portion formed at an end portion of a groove portion of the splined portion and the external diameter portion.

Claim 2. (Original) The shaft according to claim 1, further comprising:

a large diameter portion which has a diameter that is larger than a diameter of an external periphery of the splined portion and which is formed at an end portion of the external diameter portion at the splined portion side; and

a tapered portion which stops the fitting member and which is provided at a side surface of the large diameter portion at the splined portion side.

Claim 3. (Original) The shaft according to claim 2, wherein an end portion at the external diameter portion side of the curved portion is formed so as to be further from a shaft axis of the shank than the cut back portion.

Claim 4. (Original) The shaft according to claim 1, wherein two of the curved portion are provided.

· Application No. 10/673,155

Claim 5. (Original) The shaft according to claim 2, wherein two of the curved portion are provided.

Claim 6. (Original) The shaft according to claim 3, wherein two of the curved portion are provided.

Claim 7. (Withdrawn) The shaft according to claim 1, wherein two of the straight portion are provided.

Claim 8. (Withdrawn) The shaft according to claim 2, wherein two of the straight portion are provided.

Claim 9. (Withdrawn) The shaft according to claim 3, wherein two of the straight portion are provided.

Claim 10. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 1, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 11. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 2, comprising the steps of:

Application No. 10/673,155

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 12. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 3, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 13. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 4, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 14. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 5, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 15. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 6, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 16. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 7, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 17. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 8, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 18. (Withdrawn) A manufacturing method for manufacturing the shaft as in claim 9, comprising the steps of:

forming the splined portion with a predetermined shape by cold forging, machining and component rolling;

forming the curved portion by component rolling; and conducting quenching.

Claim 19. (Withdrawn) The manufacturing method for the shaft according to claim 10, further comprising the step of: conducting shot peening of the shaft.

Claim 20. (New) The shaft according to claim 2, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 21. (New) The shaft according to claim 3, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 22. (New) The shaft according to claim 4, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 23. (New) The shaft according to claim 5, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 24. (New) The shaft according to claim 6, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 25. (Withdrawn) The shaft according to claim 7, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 26. (Withdrawn) The shaft according to claim 8, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 27. (Withdrawn) The shaft according to claim 9, wherein the splined portion has a predetermined shape resulting from cold forging, machining and component rolling; forming the curved portion by component rolling; and conducting quenching.

Claim 28. (Withdrawn) The shaft according to claim 10, wherein the splined portion predetermined shape further results from shot peening.
